The goal is not prediction; it is reducing participation in large drawdowns.

Strategy	End Value	5-Year CAGR
Buy & Hold CNX 100	INR 228.8	18.0%
Sit out FY20 crash only	INR 424.8	33.5%
Sit out both negative years	INR 492.9	37.6%

- A 50% fall needs 100% gain just to recover.
- More capital survives for the next bull phase.
- Cash, hedge and redeployment decisions improve compounding.

The aim is not to avoid every fall; it is to avoid deep drawdowns that damage compounding.

Internally developed dashboards convert market data into portfolio decisions.

We first identify where money is likely to flow, then select which stocks deserve capital.

Top-Down Analysis

- Market regime: bull, correction, crash
- Sector momentum and relative strength
- Macro / policy / liquidity tailwinds
- F&O positioning and institutional flows
- Decision: overweight, avoid, hedge or rotate

Bottom-Up Stock Selection

- High relative-strength stocks
- Strong earnings / revenue growth
- Quality balance sheet
- Promoter and business quality
- Decision: entry, add, hold or exit

Top-down tells us where to look. Bottom-up tells us what to buy.

The system identified improving conditions and leadership pockets during the April-May 2026 rally.

Risk-on

Market regime

High RS

Leadership pockets

Hedge active

Risk option

- Market shifted from defensive/corrective phase to risk-on.
- System focused on high relative-strength pockets.
- Priority areas: transformer/power infrastructure, healthcare trades, high-conviction RS ideas like TruAlt.
- Increase participation when evidence improves, while keeping hedge/cash options active.

SUPER CAPITAL

Apr: 87.0%

20/23 positive closes

Apr 2026 - ~ 18% CNX 100

Sector rotation helped identify the transformer / power infrastructure pocket early.

Probability

Price structure

Risk-reward

- Sector showed strong relative strength versus broader market.
- Multiple stocks confirmed price-volume participation.
- Top-down signal: sector leadership emerging.
- Bottom-up filter: stronger balance sheets and higher conviction names.
- Action: build exposure progressively, not all at once.

Not every position needs to be long term; some are tactical when probability improves.

Probability

Price structure

Risk-reward

- Healthcare showed favourable probability / relative-strength setup.
- Positions were taken where price structure supported the thesis.
- Risk was managed through defined exit levels.
- If sector strength faded, capital could be rotated elsewhere.

SUPER CAPITAL

CASE STUDY

Yatharth Hospital and Trauma Care Service

For April last week, Nifty Healthcare has highest probability of 67% closing in Green.

We bought it on 24th April and closed with the return of 18%+ gain in a week.

This is the example of quick Tactical rotation.

High relative strength plus business conviction can justify focused allocation.

Probability

Price structure

Risk-reward

- Stock-specific thesis supported by bottom-up conviction.
- Relative strength confirmed market participation.
- Position decision based on business quality, price action, liquidity and risk.
- Add / hold decision reviewed as the trend developed.

CASE STUDY

Investment Rationale: TruAlt Bioenergy is entering an asset-utilisation and cash-flow acceleration phase after completing its major ethanol capex, with installed capacity expanded to 2,000 KLPD and 1,300 KLPD dual-feed capacity, increasing operating days from around 140 days to ~330 days/year. Near-term earnings visibility is driven by ethanol stabilisation at 5.5–6.0 crore litres/month, translating to an estimated annual volume of ~48 crore litres, revenue of ~₹3,216 crore at ₹67/litre, EBITDA of ₹579–643 crore and PAT of ₹303–385 crore at conservative utilisation assumptions. Additional margin upside comes from DDGS by-product income, estimated at ~18% of revenue when grain-based operations run efficiently. The key growth optionality is CBG, where TruAlt is scaling from 1 plant to 24+ plants through JVs with Sumitomo and GAIL, with attractive unit economics of 63% EBITDA margin and 43% PAT margin, capex of ₹65–85 crore per plant, and payback of 2.3–2.9 years. Liquidity is supported by ₹839 crore IPO proceeds, ethanol requires no further major capex, and the long-term SAF project of 100 million litres provides future upside from FY28, while the immediate thesis depends on ethanol utilisation, DDGS contribution, and timely execution of CBG projects.

The same system that helps us enter also helps us reduce risk.

- Increase exposure when probability and breadth improve.
- Hold cash when signals are mixed.
- Hedge when correction/crash risk increases.
- Rotate when leadership changes.
- Reduce positions when relative strength fades or thesis weakens.

Buying creates opportunity. Selling protects compounding.

- We expect a stock to start working after entry.
- If momentum does not come, we review quickly.
- We avoid getting stuck in dead money.
- Selling cuts weak positions, frees capital and improves return on time invested.

We start reducing when capital is not being rewarded.

- No momentum after entry.
- Relative strength fades.
- Price structure weakens.
- Market regime turns risky.
- Sector leadership changes.
- Better opportunity becomes available.
- Loss moves beyond acceptable range.
- Investment thesis weakens.

A flat stock can hurt performance even without a big loss.

- Capital remains blocked.
- Portfolio loses time.
- Stronger opportunities are missed.
- Weak stocks can later become large losses.

Return on Time Invested is as important as return on capital.

A small controlled loss is better than a large uncontrolled drawdown.

- Entry was taken with a defined thesis.
- Stock did not generate expected momentum.
- Review focused on lack of follow-through, capital efficiency and downside risk.
- Exit near 5% loss freed capital for better ideas.

A small planned loss is better than a large emotional loss.

SUPER CAPITAL

The bigger the fall, the harder the recovery.

Fall	Gain Needed
10%	11.1%
15%	17.6%
20%	25.0%
25%	33.3%
30%	42.9%
40%	66.7%
50%	100.0%
60%	150.0%
70%	233.3%
75%	300.0%

- A 10% loss is manageable.
- A 30-40% loss becomes much harder to recover from.
- A 50% loss needs the portfolio to double.
- Avoiding large drawdowns is compounding discipline.

The structure gives Super Capital active flexibility; it does not promise hedge-fund returns.
